

# CONTROL FLOW

# FILE DESCRIPTION

File names	Description
<b>matrix_generator.cpp</b>	Contains source code to generate random $n \times n$ matrix.
<b>serial.cpp</b>	Contains source code to get LU decomposition of input matrix <i>serially</i> . (i.e., without multithreading)
<b>pthread.cpp</b>	Contains source code to get LU decomposition of input matrix parallelly. (using <i>pthreads</i> )
<b>omp.cpp</b>	Contains source code to get LU decomposition of input matrix parallelly. (using <i>OpenMp</i> )
<b>looper.sh</b>	Bash file used to :- <ul style="list-style-type: none"><li>• save matrix generated by input.cpp to a text file.</li><li>• Run all the 3 implementations i.e., <i>serial</i>, <i>pthread</i> and <i>openmp</i> for different matrix sizes and threads.</li><li>• Save the output of the above three programs into a text file so that they can be used for analysis.</li></ul>
<b>graph_plot.py</b>	Python script used to :- <ul style="list-style-type: none"><li>• Read data from the text file that contains all the output.</li><li>• Plot required graphs by making use of appropriate libraries.</li></ul>
<b>MakeFile</b>	Contains code to invoke all the above mentioned programs and finally display required plots on screen.
